DECLARATION

We affirm that the Project Report titled **Online Food Ordering and Delivery Platform for CSK Food Truck** being submitted in partial fulfilment of the requirements for the award of Bachelor of Technology is the original work carried out by us. It has not formed the part of any other project report or dissertation on the basis of which a degree or award was conferred on an earlier occasion on this or any other candidate.

**Kirubasagar S
(23ITR084)**

**Kousikaa Shree S
(23ITR085)**

Date:

I certify that the declaration made by the above candidates is true to the best of my knowledge.

Date:

Name and Signature of the Supervisor with seal

ACKNOWLEDGEMENT

First and foremost, we acknowledge the abundant grace and presence of Almighty throughout different phases of the project and its successful completion.

We express our gratefulness to Correspondent **Thiru. E. R. K. Krishnan, M.Com.** and all the trust members of Kongu Vellalar Institute of Technology Trust for providing all the necessary facilities to complete the project successfully.

We express our deep sense of gratitude to our beloved Principal **Dr.R.Parameshwaran M.E.,Ph.D.**, for providing us an opportunity to complete the project.

We express our gratitude to **Dr. S. Anandamurugan M.E.,Ph.D.**, Head of the Department, Department of Information Technology for his valuable suggestions.

We are thankful to our Project Coordinators **Dr.E.M.Roopa Devi M.E,Ph.D., Ms.S.Sujitha M.Tech** and **G.Sasikala M.E.**, for their valuable guidance and support.

We are highly indebted to **Dr.V.Devisurya M.E, Ph.D.**, Department of Information Technology for her valuable supervision and advice for the fruitful completion of the project.

We are thankful to the faculty members of the Department of Information Technology for their valuable guidance and support.

We are obliged to thank **Mrs K.Vanishree**, Owner of **CSK Food Truck** for supporting us through the various development phases of the project with utmost trust.

ABSTRACT

A web-based food ordering and management application was developed for CSK Food Truck, Theni to streamline and digitize the food ordering process and business operations. The platform provides an efficient online environment where customers can browse food items, place orders, and track deliveries in real time. By implementing this digital solution, the system bridges the gap between traditional offline food ordering methods and modern online food service platforms.

The application offers a simple, responsive, and user-friendly interface that enhances the overall customer experience. Users can explore various food categories, manage their cart, and securely complete transactions using integrated payment options such as online payment gateways and cash on delivery. Additionally, real-time order tracking using location-based services improves transparency and customer satisfaction.

The system also includes a powerful administrative dashboard that enables administrators to manage menu items, monitor orders, track revenue, and control delivery operations efficiently. This centralized control helps in improving operational efficiency, reducing manual work, and ensuring better service management. Developed using the MERN stack (MongoDB, Express.js, React.js, and Node.js), the application ensures scalability, performance, and maintainability. Integration with third-party services such as Cloudinary for image storage, Razorpay for payment processing, and Google Maps API for live tracking further enhances the system's capabilities.

Overall, the CSK Food Truck platform demonstrates how modern web technologies can transform traditional food service operations into a scalable digital solution, improving customer engagement while enabling business growth and future expansion.

CHAPTER 1

INTRODUCTION

1.1 OVERVIEW

The increasing adoption of digital technology has made it essential for businesses to provide online platforms for services and customer interactions. This project focuses on developing a web-based food ordering and management application for CSK Food Truck Theni to simplify and enhance the process of food ordering and delivery services. The platform enables users to browse available food items, place orders, and track deliveries through an easy-to-use and responsive online interface. The system also provides administrative features that allow administrators to manage menu items, monitor customer orders, and maintain overall system functionality efficiently. By digitizing the food ordering process, the application reduces manual efforts, improves order accuracy, and enhances the overall customer experience. This solution supports better customer engagement, streamlined business operations, and provides a scalable foundation for future improvements and digital expansion of CSK Food Truck.

1.2 OBJECTIVE

- To develop a web-based food ordering and management application for CSK Food Truck Theni that simplifies the process of browsing food items, placing orders, and managing deliveries through an online platform.
- To create an intuitive and user-friendly interface that allows users to explore food categories, manage their cart, make secure payments, and track their orders conveniently.
- To provide an efficient administrative system that enables administrators to manage menu items, monitor customer orders, track revenue, and maintain the overall functionality of the platform effectively.

CHAPTER 2

SYSTEM SPECIFICATION

2.1 HARDWARE REQUIREMENTS

Processor	:	Intel Core i7
Processor Speed	:	250MHz to 667MHz
RAM	:	4GB RAM
Hard Disk	:	256GB
Keyboard	:	Standard 104 enhanced
Mouse	:	Optical / USB Mouse

2.2 SOFTWARE REQUIREMENTS

Platform	:	Visual Studio Code
Server-Side Script	:	NodeJS
Operating System	:	Windows, macOS, or Linux
Frontend	:	React.js with Vite
Backend	:	Express.js
Database	:	MongoDB Atlas
Styling	:	Tailwind CSS
Authentication	:	JWT (JSON Web Token), bcrypt

2.3 SOFTWARE DESCRIPTION

2.3.1 Visual Studio Code

Visual Studio Code is a versatile and user-friendly code editor used by developers worldwide. It supports a wide range of programming languages and frameworks, including JavaScript, React, and Node.js. For this project, VS Code provides a convenient environment for writing, editing, and debugging code related to server-side scripting with Node.js, as well as client-side scripting with React.js. Its built-in terminal and debugging tools streamline the development process, while its customizable features allow developers to tailor the editor to their specific needs, enhancing productivity and efficiency throughout the project lifecycle.

- **ES6+ React/Redux/React-Native:**

ES6 React/Redux/React-Native snippets provide code templates designed to simplify and accelerate the development process for building applications with React, Redux, and React Native. These snippets utilize the powerful features introduced in ES6, allowing developers to quickly scaffold common patterns like React components, Redux actions, reducers, and React Native components. By incorporating ES6 syntax, such as arrow functions, destructuring, template literals, and modules, these snippets make it easier to write clean and concise code. With ES6 snippets, developers can efficiently generate standardized code structures that promote consistency and reduce the chance of errors, cutting down on boilerplate code. This collection of snippets supports the creation of both web applications in React and cross-platform mobile applications in React Native, while simplifying state management in Redux. Whether developing user interfaces, managing state, or working on cross-platform features, these ES6 snippets help developers stay focused on creating features and solving problems instead of repeating boilerplate setup.

2.3.2 NodeJS

Node.js is a powerful server-side JavaScript runtime environment commonly used for building scalable and efficient web applications. In our project, Node.js serves as

the server-side scripting language, handling tasks such as routing, handling HTTP requests, and interacting with the MongoDB database. Its event-driven architecture and non-blocking I/O operations make it well-suited for handling concurrent connections and processing requests efficiently. With its vast ecosystem of libraries and frameworks, Node.js allows for rapid development and deployment of server-side applications. Additionally, its compatibility with Visual Studio Code provides a seamless development experience, enabling developers to write, test, and debug server-side code effectively within a unified environment. Overall, Node.js plays a crucial role in this project by powering the backend infrastructure and facilitating the seamless integration of frontend and backend components.

- **Bcryptjs**

Bcryptjs is a library used for hashing passwords in JavaScript. It provides a secure way to hash passwords before storing them in a database or comparing them during authentication processes. By using bcryptjs, developers can ensure that user passwords are encrypted and protected against common security threats like brute force attacks and rainbow table attacks.

- **Express**

Express is a minimalist web application framework for Node.js. It provides a robust set of features for building web servers and APIs, including routing, middleware support, template engines, and HTTP utilities. With its simple and flexible design, Express enables developers to quickly create scalable and maintainable web applications.

- **Jsonwebtoken (JWT)**

JSON Web Token is an open standard (RFC 7519) that defines a compact and self-contained way for securely transmitting information between parties as a JSON object. JWTs are commonly used for authentication and authorization in web applications. The jsonwebtoken library provides utilities for generating, parsing, and verifying JWTs, making it easy to implement token-based authentication and authorization systems.

2.3.3 MongoDB

MongoDB is a flexible and scalable NoSQL database platform that is well suited for managing the data requirements of the consultancy web application developed for CSK food Truck. With MongoDB's document-oriented architecture, the system can efficiently store and manage different types of data such as user information, consultancy service details, client inquiries, and administrative records. Its schema-less structure allows the application to handle dynamic and evolving data models, which is beneficial for managing various consultancy services and client interactions within the platform. For this project, MongoDB's scalability plays an important role as it can efficiently handle increasing amounts of user data and service requests while maintaining optimal performance. This ensures that the consultancy platform remains responsive even as the number of users and inquiries grows. MongoDB's powerful query capabilities and indexing features enable fast retrieval of information such as user profiles, consultancy service details, and client requests, which improves the overall efficiency and user experience of the system. Additionally, MongoDB supports high availability and reliable data management, helping the platform remain stable and accessible. By providing a secure, flexible, and scalable database solution, MongoDB plays a vital role in supporting the functionality of the CSK food Truck consultancy application, ensuring efficient data storage, smooth system performance, and the ability to support future enhancements.

2.3.4 React

React is a popular JavaScript library used to build interactive and responsive user interfaces. In the consultancy web application developed for CSK Food Truck, React helps create a dynamic frontend where users can easily explore consultancy services, submit inquiries, and interact with the platform. Its component-based architecture allows the application to be divided into reusable parts such as service pages, forms, and navigation components, making the system easier to develop and maintain. React also improves application performance through its virtual DOM, which updates only the necessary parts of the interface instead of reloading the entire page. This ensures faster rendering and a smooth user experience. By enabling efficient communication with

backend APIs, React helps display data such as services and client requests dynamically, making the platform responsive, scalable, and user-friendly.

- **axios:**

Axios is a promise-based HTTP client for making HTTP requests in browser-based and Node.js applications. It provides a simple and intuitive API for performing asynchronous HTTP requests, handling request and response data, and intercepting request and response lifecycle events. Axios supports features like request and response interception, request cancellation, automatic JSON data parsing, and more, making it a popular choice for handling AJAX requests in JavaScript applications.

- **react-navigation:**

React-navigation is a popular routing and navigation library specifically designed for React Native applications. It enables smooth and intuitive navigation between screens using stacks, tabs, and drawer navigators. The library handles navigation history, parameter passing, and screen transitions efficiently across both Android and iOS platforms. It provides a customizable and scalable solution for managing complex navigation flows in mobile apps, ensuring a seamless user experience and structured app architecture.

- **React Router DOM:**

React Router DOM is a standard routing library used in React applications to manage navigation between different pages. It enables the creation of multiple routes such as home, services, contact, and dashboard pages without reloading the entire website. This improves the user experience by providing smooth navigation and better organization of the application structure.

- **Bootstrap / CSS Framework:**

Bootstrap is a widely used front-end framework that helps design responsive and visually appealing web interfaces. It provides pre-designed components such as buttons, forms, navigation bars, and layouts. Using Bootstrap in this consultancy application improves the overall design, responsiveness, and user experience across different devices.

- **React Toastify:**

React Toastify is a library used to display notifications in React applications. It allows developers to show success, error, or warning messages in a simple and visually appealing way. In this project, React Toastify helps notify users about actions such as successful form submissions, login status, or error messages, improving the overall user experience.

CHAPTER 3

SYSTEM DESIGN

3.1 USE CASE DESIGN

A use case diagram is a dynamic or behavior diagram in UML (Unified Modelling Language). Use case diagrams model the functionality of a system using actors and use cases. Use cases are a set of actions and functions that the system needs to perform. A "system" is something being developed or operated, here is a website. The "actors" are people or entities operating under defined roles within the system as shown below in Figure 3.1.

Fig 3.1 Use Case Diagram

3.2 CLASS DIAGRAM

A class diagram is a static structure diagram in UML (Unified Modeling Language) that illustrates the structure of a system by showing the classes of the system, their attributes, methods, and relationships between them as shown in Figure 3.2. Classes represent the blueprint for objects, encapsulating data and behavior. Attributes are the data members of a class, while methods represent the operations that can be performed on the class's objects.

Fig 3.2 Class Diagram

3.3 SEQUENCE DIAGRAM

A sequence diagram is a form of interaction diagram which shows objects as lifelines running down the page, with their interactions over time represented as messages drawn as arrows from the source lifeline to the target lifeline. Sequence diagrams are good at showing which objects communicate with which other objects and what messages trigger those communications as shown below in Figure 3.3. Sequence diagrams are not intended for showing complex procedural logic.

Fig 3.3 Sequence Diagram

3.4. ACTIVITY DIAGRAM

In UML, the activity diagram is used to demonstrate the flow of control within the system rather than the implementation. It models the concurrent and sequential activities. The activity diagram helps in envisioning the workflow from one activity to another. It put emphasis on the condition of flow and the order in which it occurs. The flow can be sequential, branched or concurrent and to deal with such kinds of flows, the activity diagram has come up with a fork, join, etc. as shown in the Figure 3.4 below.

Fig 3.4 Activity Diagram

3.5 DATABASE DESIGN

User Schema:

```
const mongoose = require("mongoose");
const UserSchema = new mongoose.Schema({
  name: String,
  email: String,
  phone: String,
  password: String,
  role: {
    type: String,
    enum: ["user", "admin"],
    default: "user"
  },
  createdAt: {
    type: Date,
    default: Date.now
  }
});
const User = mongoose.model("User", UserSchema);
```

Food Schema:

```
const FoodSchema = new mongoose.Schema({
  name: String,
  description: String,
  category: String,
  price: Number,
  image: String,
  createdAt: {
    type: Date,
    default: Date.now
  }
});
```

Cart Schema:

```
const ProjectSchema = new
mongoose.Schema({ const CartSchema = new
mongoose.Schema({
  userId: {
    type: mongoose.Schema.Types.ObjectId,
    ref: "User"
  },
  items: [
    {
      foodId: {
        type: mongoose.Schema.Types.ObjectId,
        ref: "Food"
      },
      quantity: Number
    }
  ],
}
```

```

    updatedAt: {
      type: Date,
      default: Date.now
    }
  });

```

```

const Cart = mongoose.model("Cart",
  CartSchema);

```

Request Schema:

```

const ConsultationSchema = new mongoose.Schema({
  userId: {
    type: mongoose.Schema.Types.ObjectId,
    ref: "User"
  },
  serviceId: {
    type: mongoose.Schema.Types.ObjectId,
    ref: "Service"
  },
  message: String,
  status: {
    type: String,
    default: "Pending"
  },
  createdAt: {
    type: Date,
    default: Date.now
  }
});

```

```

const Consultation = mongoose.model("Consultation", ConsultationSchema);

```

3.6 MODULES DESCRIPTION

3.6.1 User Authentication Module

The User Authentication Module is responsible for managing user registration, login, and access control within the system. It ensures that only authorized users can access specific features of the application. New users can create an account by providing details such as name, email, phone number, and password. The system securely stores user credentials by encrypting passwords using bcrypt. During login, the system verifies user credentials and generates a JSON Web Token (JWT) to maintain secure sessions. This module also implements role-based access control, distinguishing between normal users and administrators. By ensuring secure authentication and authorization, this module protects user data and maintains the integrity of the system.

3.6.2 Menu Management Module

The Menu Management Module allows administrators to manage food items available on the platform. It provides functionalities to add new food items, update existing details, and remove items from the menu. Each food item includes attributes such as name, description, category, price, and image. This module integrates with Cloudinary for efficient image storage and retrieval. It ensures that the menu is always up-to-date and reflects the current offerings of the food truck. By providing an easy-to-use interface, this module helps administrators efficiently manage menu data and maintain consistency across the application.

3.6.3 Food Browsing & Search Module

The Food Browsing and Search Module enables users to explore available food items in an organized and user-friendly manner. Users can view food items categorized into different sections such as biryani, burgers, wraps, and more. This module also provides search and filtering options to help users quickly find their desired items. The dynamic interface built using React ensures smooth navigation and real-time updates. This module enhances user experience by making the food selection process simple, fast, and interactive.

3.6.4 Cart and Order Placement Module

The Cart and Order Placement Module allows users to add selected food items to their cart and manage quantities before placing an order. Users can update or remove items from the cart and view the total cost dynamically. Once the user confirms the order, the system processes the order details, including selected items, total amount, and delivery address. The order is then stored in the database and forwarded to the admin panel for further processing. This module ensures accurate order handling and provides a seamless checkout experience.

3.6.5 Payment Integration Module

The Payment Integration Module enables users to complete transactions securely using different payment methods. The system supports both online payments through Razorpay and offline payment options such as Cash on Delivery (COD). For online transactions, the module handles payment processing, verification, and status updates. It ensures that all transactions are secure and reliable. This module plays a crucial role in providing a smooth and trustworthy payment experience for users.

3.6.6 Admin Dashboard Module

The Admin Dashboard Module provides a centralized interface for administrators to monitor and manage the entire system. It displays important analytics such as total orders, total revenue, and recent transactions. Administrators can view and update order statuses, manage food items, and oversee delivery operations. This module improves operational efficiency by providing real-time insights and control over the system. It plays a vital role in ensuring smooth business operations and effective decision-making.

CHAPTER 4

TESTING

4.1 SYSTEM TESTING

System testing is a comprehensive evaluation conducted to ensure that the complete and integrated system meets the defined requirements. In the CSK Food Truck web application, system testing covered core functionalities such as browsing food items, managing the shopping cart, placing orders, processing payments, and accessing the admin dashboard for menu and order management. Special attention was given to the overall user experience, ensuring that customers can easily navigate the platform, explore food categories, place orders, and track their deliveries without any difficulty. The testing also verified UI responsiveness, backend communication using Node.js and Express.js, secure authentication using JWT, and proper data storage and retrieval from MongoDB. Additionally, payment processing through Razorpay and order status updates were tested to ensure reliability. The main objective of system testing was to ensure that the platform operates smoothly and provides a secure, efficient, and user-friendly experience for both customers and administrators of CSK Food Truck.

4.2 UNIT TESTING

Unit testing is the first level of testing and focuses on testing individual components or functions independently. In the CSK Food Truck web application, unit testing was performed on both frontend and backend components to ensure that each part of the system functions correctly. On the frontend, React components such as food item displays, cart interface, login and signup forms, navigation elements, and input fields were tested to verify proper rendering and correct response to user interactions. Form validations, cart updates, and user input handling were also checked to ensure accurate data processing and smooth user experience. On the backend, Node.js functions responsible for user authentication, food management, order processing, and database operations with MongoDB were tested. These tests helped identify errors at an early stage, improving code quality, reliability, and simplifying the debugging process.

4.3 MODULE TESTING

Module testing was conducted to evaluate the performance and correctness of different functional modules within the CSK Food Truck web application. Each module was treated as an independent unit and tested to ensure that its internal functions operate correctly and consistently. For example, the User Authentication Module was tested for user registration, login, and role-based access control. The Menu Management Module was evaluated for adding, updating, and displaying food items. The Cart and Order Module was tested to ensure that users can add items to the cart, update quantities, and place orders successfully. The Payment Module was also tested to verify secure transaction processing and proper status updates. By testing each module individually, the system ensured that data processing, control flow, and module functionality worked correctly before integrating them with other parts of the application.

4.4 INTEGRATION TESTING

Integration testing was carried out to verify the interaction between different modules of the CSK Food Truck web application. It ensured that modules such as user authentication, food browsing, cart management, order placement, payment processing, and the admin dashboard work together correctly when integrated. For example, when a user places an order, the selected items from the cart should be correctly processed, payment should be completed successfully, and the order details should be stored in the MongoDB database. API requests made from the React frontend to the Node.js and Express.js backend were tested to confirm correct data exchange and proper error handling. The integration between the application and MongoDB Atlas was also tested to ensure reliable data storage and retrieval. This testing helped ensure smooth communication between modules and provided a seamless experience for both customers and administrators.

4.5 VALIDATION TESTING

Validation testing was performed to ensure that the CSK Food Truck web application meets all the defined functional and non-functional requirements. The application was evaluated based on its primary objectives, such as browsing food items, managing the cart, placing orders, making payments, and tracking deliveries through the platform. Form input validations were implemented to ensure that users provide correct and complete information during registration, login, and order placement. Different scenarios such as invalid login credentials, incomplete order details, failed payment

attempts, and server response handling were tested to ensure the system responds appropriately. The application was also tested for responsiveness across different devices and screen sizes to ensure a smooth user experience. This testing phase confirmed that the system functions correctly under real-world conditions and meets both technical requirements and user expectations, ensuring a reliable and user-friendly platform for CSK Food Truck.

CHAPTER 5

RESULTS AND DISCUSSION

The CSK Food Truck web application provides a modern digital platform that enhances the way customers interact with food ordering services and enables efficient business management. The system allows users to easily browse available food items, add them to the cart, place orders, and track deliveries through a simple and user-friendly interface. By shifting these operations to an online platform, the application reduces traditional ordering limitations and enables customers to access services more conveniently from anywhere. The application is developed using modern web technologies including React for the frontend, Node.js and Express.js for the backend, and MongoDB for database management. These technologies work together to ensure efficient data processing, smooth communication between the frontend and backend, and reliable storage of information such as user details, food items, and order records.

The platform also includes an admin dashboard that allows administrators to manage menu items, monitor customer orders, track revenue, and control delivery operations effectively, thereby improving overall business efficiency. Extensive testing was conducted to ensure that the system performs reliably under different conditions. The application was tested for functionality, responsiveness, and data accuracy to ensure that users can navigate the platform easily and complete actions without errors. The system provides fast response times, proper validation of user inputs, secure authentication, and seamless interaction between different modules. Payment integration and order tracking features were also tested to ensure reliability and user satisfaction. Overall, this project demonstrates how digital technology can modernize traditional food service operations and improve customer engagement. The CSK Food Truck platform strengthens the business's online presence, enhances customer convenience, and provides a scalable solution that can support future enhancements such as mobile applications, personalized recommendations, and advanced analytics features.

CHAPTER 6

CONCLUSION AND FUTURE WORK

The CSK Food Truck web application successfully fulfills its objective of providing a modern digital platform for food ordering and business management. By utilizing technologies such as React for the frontend, Node.js and Express.js for backend development, and MongoDB for database management, the system ensures reliable performance and efficient data handling. The application allows users to easily browse food items, place orders, make payments, and track deliveries, while the admin dashboard enables administrators to manage menu items, monitor orders, and track revenue effectively.

The implementation of this system improves the business's online presence and simplifies the food ordering process for customers. It reduces manual efforts in managing orders and menu updates while providing a structured and user-friendly interface. The platform bridges the gap between traditional food ordering methods and modern digital solutions, helping CSK Food Truck Theni reach a wider audience and enhance customer engagement.

Looking ahead, several enhancements can further improve the system. Future developments may include mobile application support for better accessibility, integration of advanced notification systems such as SMS or WhatsApp alerts, AI-based food recommendations, and improved delivery tracking features. Additional features such as multi-language support, advanced analytics for business insights, and enhanced UI/UX design can also be implemented to improve user experience. These future improvements will strengthen the platform's capabilities and support the long-term digital growth of CSK Food Truck Theni.

APPROVAL LETTER FROM THE COMPANY

 CSK Chicken Shawarma & Kebab	CHICKEN SHAWARMA & KEBAB 7402065058  csktrucktheni@gmail.com  721, Periyakulam Road, Theni, 625531 
Date: 15/12/2025 To Dr.V.DEVISURYA Assistant Professor (SRG) Department of Information Technology Kongu Engineering College, Perundurai - 638060 Subject: Approval for Consultancy Collaboration Dear Dr.V.DEVISURYA Greetings from CSK! We are pleased to inform you that your proposal for a consultancy work titled "Online Food Ordering and Delivery Platform" has been reviewed and approved by our management. We appreciate your interest in collaborating with us and look forward to a productive association that will bring mutual benefits. As per the discussion and agreement, the scope of your consultancy services will include: - Expanding customer reach and provide best food ordering accessibility - Enable secure and seamless online payments with real time order tracking The duration of the consultancy will be from 15-12-2025 to 30-03-2026, and the agreed consultancy fee is Rs. 10000/- inclusive of applicable taxes. We believe your expertise will significantly contribute to the success of this work. Kindly acknowledge your acceptance of the terms mentioned above by signing the duplicate copy of this letter. Looking forward to a fruitful collaboration. Thank you. Warm regards,  K. Vanishree Owner, CSK (Theni)

Subject: Consultancy Work Completion Acknowledgement

Dear Dr.V.DEVISURYA
Greetings from CSK!

This is to formally acknowledge the successful completion of the consultancy work titled "**Online Food Ordering and Delivery Platform**", which was carried out in collaboration with us during the period **15-12-2025 to 30-03-2026**.

We are pleased with the professionalism, technical expertise, and dedication you have demonstrated throughout the consultancy engagement. The deliverables and milestones outlined in the agreement have been met to our complete satisfaction, and we sincerely appreciate your efforts in ensuring the timely and successful execution of this consultancy.

We look forward to future collaborations and wish you continued success in your academic and professional endeavours.

Thank you once again for your valuable support.
Warm regards.

MAPPING OF SDG TO PROJECT WORK

Sustainable Development Goals (SDGs) are a set of global goals established by the United Nations to promote sustainable development and improve the quality of life for people around the world. They focus on important areas such as economic growth, environmental protection, innovation, education, and social equality. By integrating sustainable practices and technologies, different sectors—including digital platforms like e-commerce—can contribute to achieving these goals and creating a better and more sustainable future for society.

SDG 9 – Industry, Innovation and Infrastructure

This project aligns with Sustainable Development Goal 9 (Industry, Innovation, and Infrastructure) by introducing digital innovation into the traditional food service and street food industry. The CSK Food Truck web application, developed using the MERN stack (MongoDB, Express.js, React.js, and Node.js), modernizes the way customers interact with food truck services by providing a fully functional online food ordering platform. Users can browse menus, place orders, track their purchases, and make secure online payments, thereby improving convenience and accessibility.

Furthermore, the integration of online payment systems and real-time order management strengthens digital infrastructure and supports cashless transactions. This not only improves customer experience but also encourages the growth of digital economies in local communities. By leveraging modern web technologies and scalable infrastructure, the project fosters innovation, enhances business productivity, and contributes to the development of a more technologically advanced and sustainable food service ecosystem, thereby supporting the objectives of Sustainable Development Goal 9.
